Engage

DESCRIPTION

Hiya!

During this period of time, you should have gained a lot of knowledge.

Have you ever thought about automating your daily routine? As a developer, you must always think about automation of your work and work of programs. As soon as you notice a repeating pattern, you must automate it.

Automating the build of a program saves time and effort. Compiling source code into binary code, packaging binary code, running automated tests, cleaning garbage, uninstalling a program, etc. These and many more processes can be done using a Makefile.

Another way to automate software development lies in function calls. Wouldn't it be convenient to call functions indirectly through a variable? In this Sprint you have a great opportunity to learn a new concept called a function pointer.

BIG IDEA

Automation.

ESSENTIAL QUESTION

What automation tools can be used in C programming?

CHALLENGE

Build programs using a Makefile.

Investigate

GUIDING QUESTIONS

We invite you to find answers to the following questions. By researching and answering them, you will gain the knowledge necessary to complete the challenge. To find answers, ask the students around you and search the internet. We encourage you to ask as many questions as possible. Note down your findings and discuss them with your peers.

- What is the standard stream in C?
- What is a macro?
- How does the compiler process macros?
- How does a Makefile work?
- What is the scope of use of function pointers?
- What is the syntax of function pointers in C?
- What is a binary file?
- What is enumeration in C?
- Should the Makefile relink objects if they haven't changed?
- What are wildcards and how to use them?
- What are automatic variables and how to use them?
- Is there something useful about Makefiles in the Auditor?
- What is a static library and how to create it?
- What is a conditional operator and how to write it in C?
- Where could you use conditional operators?

GUIDING ACTIVITIES

Complete the following activities. Don't forget that you have a limited time to overcome the challenge. Use it wisely. Distribute tasks correctly.

- Repeat the basics from the previous challenges. Repeat everything you know and do not know about pointers, because in this challenge they will also be needed.
- Read about the standard error stream stderr and how to work with it.
- · Research and think about when and why you need to use macros.
- Find information about function pointers in C. Try to use them in practice.
- Try to understand why you need a Makefile.
- Read this article about Makefiles. Keep in mind that this article is just a brief introduction, research this tricky topic more by yourself. Pay close attention to it.
- Define the required directory structure for the source code and develop the solution.
- · Clone your git repository that is issued on the challenge page in the LMS.

- Arrange brainstorming sessions with other students.
- Try to implement your thoughts in code.
- Push the solution to the repository.

ANALYSIS

Analyze your findings. What conclusions have you made after completing guiding questions and activities? In addition to your thoughts and conclusions, here are some more analysis results.

- Be attentive to all statements of the story. Examine the given examples carefully. They may contain details that are not mentioned in the task.
- · Analyze all information you have collected during the preparation stages.
- Perform only those tasks that are given in this document.
- Submit your files using the layout described in the story. Only useful files allowed, garbage shall not pass!
- Compile C-files with clang compiler and use these flags: clang -std=c11 -Wall -Wextra -Werror -Wpedantic.
- Your program must manage memory allocations correctly. A memory that is no longer needed must be freed, otherwise, the task is considered incomplete.
- Pay attention to what is allowed in a certain task. Use of forbidden stuff is considered a cheat and your tasks will be failed.
- Complete tasks according to the rules specified in the Auditor .
- The solution will be checked and graded by students like you. Peer-to-Peer learning.
- · Also, the challenge will pass automatic evaluation which is called Oracle.
- If you have any questions or don't understand something, ask other students or just Google it.
- Use your brain and follow the white rabbit to prove that you are the Chosen one!

NAME

Print error

DIRECTORY

t.00/

SUBMIT

printerr.h, mx_printerr.c, mx_strlen.c

ALLOWED FUNCTIONS

write

DESCRIPTION

Create a function that outputs a string of characters to the standard error stream stderr.

SYNOPSIS

void mx_printerr(const char *s);

FOLLOW THE WHITE RABBIT

man 2 write man stderr

NAME

Macros

DIRECTORY

t01/

SUBMIT

macros.h

ALLOWED FUNCTIONS

Mone

DESCRIPTION

Create a macros.h file that contains single-line function-like macros:

- MX_SUM(x, y) returns the sum of arguments x, y
- MX_MULT(x, y) returns the multiplication of arguments x, y
- MX_MIN(x, y) returns the smallest of arguments x, y
- MX_ABS(x) returns the absolute value of the argument x
- MX_IS_ODD(x) returns 1 if the argument x is odd and 0 in other cases

Oracle will test this header with its main.

SEE ALSO

Macros

NAME

Makefile: first encounter

DIRECTORY

t02/

SUBMIT

Makefile, inc/*.[h], src/*.[c]

BINARY

minilibmx.a

FORBIDDEN STUFF

*, ?, %, \$@, \$<, \$\

DESCRIPTION

Create a Makefile without wildcards that:

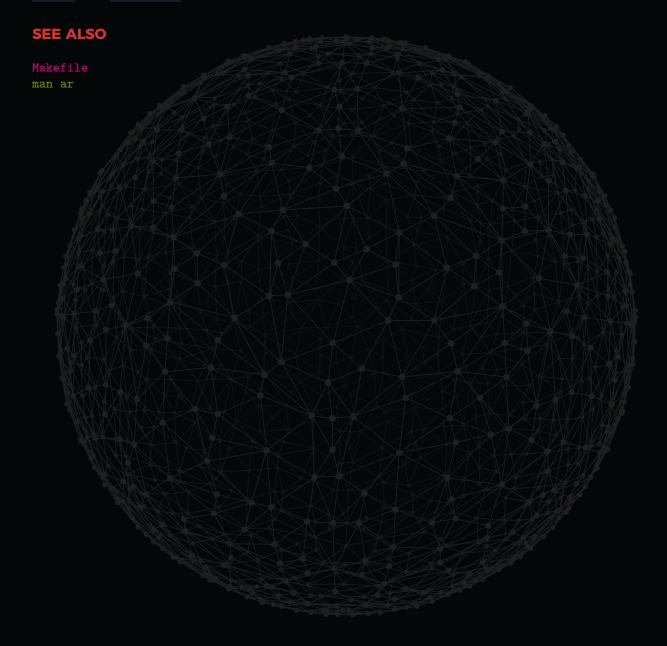

- gets source files from the src directory
- gets header files from the inc directory
- compiles object files in the obj directory
- build the binary in the root directory of the project

The following nine mandatory functions of your minilib must be handled:

- mx_atoi
- mx_isdigit
- mx isspace
- mx printchar
- mx_printint
- mx printstr
- my streny
- mx strcmp
- mx strler

Read the Auditor to find out more about Makefile conventions. For example, this time, your Makefile must have at least the following rules: all, MINILIBMX, uninstall, clean and reinstall.

NAME

Makefile: second encounter

DIRECTORY

t.037

SUBMIT

Makefile. inc/*.[h]. src/*.[c]

BINARY

minilibmx.a

DESCRIPTION

In this task, follow the instructions below:

- do everything that you were asked to in the previous task, but, this time, with wildcards
- every file name must be mentioned in the Makefile only once
- do not forget about Auditor

NAME

Comparator

DIRECTORY

t04/

SUBMIT

mx_comparator.c

ALLOWED FUNCTIONS

None

DESCRIPTION

In this task, follow the directions below:

- ullet create a function that searches the integer x in the array arr given size
- searching criteria must be defined in bool (*compare)(int, int) passed as a function pointer parameter, in which the first parameter is the array element and the second is x

RETURN

- returns the index of the first element in the array matching true criteria of the compare function
- returns -1 in case of errors or if x has not been found

SYNOPSIS

```
int mx_comparator(const int *arr, int size, int x, bool (*compare)(int, int));
```

EXAMPLE

```
bool equal_nums(int a, int b) {
    return a == b;
}

arr = {1, 2, 3, 4, 5};

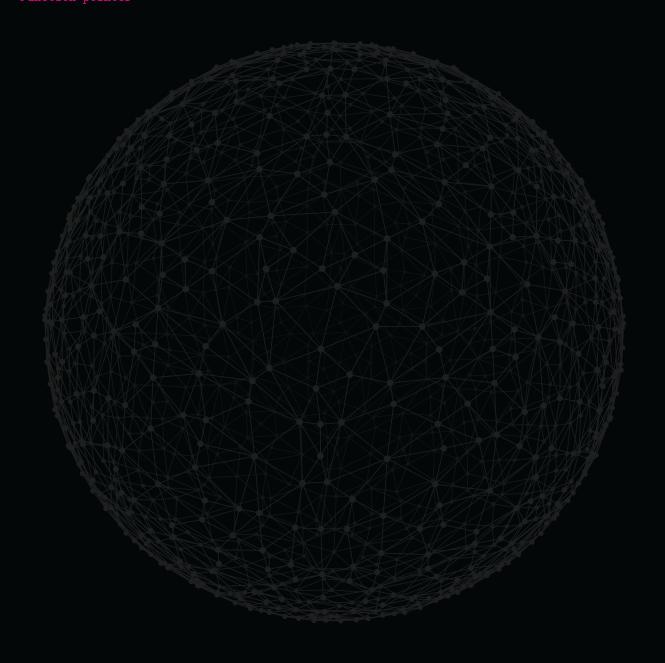

mx_comparator(arr, 5, 3, equal_nums); //returns 2

mx_comparator(arr, 5, -1, equal_nums); //returns -1
```

SEE ALSO

Function pointer

NAME

For each

DIRECTORY

t.05/

SUBMIT

mx foreach.

ALLOWED FUNCTIONS

Mone

DESCRIPTION

Create a function that applies the function f for each element of the array arr given size.

SYNOPSIS

```
void mx_foreach(const int *arr, int size, void (*f)(int));
```

EXAMPLE

```
void mx_printint(int n);

arr = {1, 2, 3, 4, 5};

mx_foreach(arr, 5, mx_printint); //prints "12345" to the standart output
```

SEE ALSO

Function pointer

NAME

The running time

DIRECTORY

t.06

SUBMIT

mx timer.c

ALLOWED FUNCTIONS

clock

DESCRIPTION

Create a function that calculates the execution time of the function f in seconds.

RETURN

- returns the execution time of the function f in seconds
- \bullet returns -1 in case of errors

SYNOPSIS

double mx_timer(void (*f)());

FOLLOW THE WHITE RABBIT

man clock

NAME

Sort with comparator

DIRECTORY

t.07/

SUBMIT

mx_sort.c

ALLOWED FUNCTIONS

None

DESCRIPTION

Create a function that sorts an array of integers in place in the order defined by the function ${\bf f}$.

SYNOPSIS

```
void mx_sort(int *arr, int size, bool (*f)(int, int));
```

EXAMPLE

```
bool compare(int a, int b) {
    return a > b;
}
arr = {5, 4, 3, 2, 1};
mx_sort(arr, 5, compare); //array has become '{1, 2, 3, 4, 5}'
```

NAME

Calculator

DIRECTORY

t08/

SUBMIT

Makefile. inc/minilibmx.h. src/*.[c]

ALLOWED FUNCTIONS

write, malloc, exit

BINARY

calc

DESCRIPTION

Create a simple command-line calculator program.

- The calculator must obtain two operands and the operation as command-line arguments and output the result of the math equation to the standard output followed by a newline.
- The program must support five math operations: addition, subtraction, multiplication, division, modulo.
- You must use the t_operation to match each math operation with the corresponding function.
- You must use the enum e_operation .
- You must use the enum e_error for error handling.
- Usage and error messages must be printed to the standard error stream stderr, and must exactly match the messages listed in the CONSOLE OUTPUT

Tips for this task

- 1. All other stuff required to be in header files must be included in the minilibmx.h.
- 2. Oracle will compile your program with our calculator.h which is listed in the SYNOPSIS
- 3. You must not SUBMIT inc/calculator.h but your Makefile must compile the program with it.

SYNOPSIS

```
#ifndef CALCULATOR H
int mx_add(int a, int b);
int mx_sub(int a, int b);
int mx_mul(int a, int b);
int mx_div(int a, int b);
int mx_mod(int a, int b);
typedef struct s_operation {
    char op;
    int (*f)(int a, int b);
               t_operation;
enum e_operation {
    SUB,
    ADD,
    MUL,
    DIV,
    MOD
};
enum e_error {
    INCORRECT_OPERAND,
    INCORRECT_OPERATION,
    DIV_BY_ZERO
};
```

CONSOLE OUTPUT

```
>./calc | cat -e
usage: ./calc [operand1] [operation] [operand2]
>./calc 5 / 0 | cat -e
error: division by zero
>./calc 34az + 2147483641 | cat -e
error: invalid number
>./calc 5 @ 5 | cat -e
error: invalid operation
>./calc 5 + 5 | cat -e
10$
>
```

Share

PUBLISHING

Last but not least, the final stage of your work is to publish it. This allows you to share your challenges, solutions, and reflections with local and global audiences. During this stage, you will discover ways of getting external evaluation and feedback on your work. As a result, you will get the most out of the challenge, and get a better understanding of both your achievements and missteps.

To share your work, you can create:

- a text post, as a summary of your reflection
- charts, infographics or other ways to visualize your information
- a video, either of your work, or a reflection video
- an audio podcast. Record a story about your experience
- a photo report with a small post

Helpful tools:

- Canva a good way to visualize your data
- QuickTime an easy way to capture your screen, record video or audio

Examples of ways to share your experience:

- Facebook create and share a post that will inspire your friends
- YouTube upload an exciting video
- GitHub share and describe your solution
- Telegraph create a post that you can easily share on Telegram
- Instagram share photos and stories from ucode. Don't forget to tag us :)

Share what you've learned and accomplished with your local community and the world. Use #ucode and #CBLWorld on social media.
